NO_X Emission Test Report

For

GE Appliances

Office Address:

GE Appliances 4000 Buechel Bank Rd Louisville, KY 40225

Production Facility Address:

GE Appliances 50 Haier Blvd Camden, SC 29020

June 10, 2022

Three (3) GE gas-fired residential storage tank water heaters were tested per South Coast Air Quality Management District (SCAQMD) - Protocol, "Nitrogen Oxide Emissions Compliance Testing for Natural Gas-Fired Water Heaters and Small Boilers", March 1995 (Amended January 1998). The water heaters were tested at Appliance Engineering, Inc. in Twinsburg, OH. Appliance Engineering, Inc. is a certified SCAQMD NOx testing laboratory under the SCAQMD's Laboratory Approval Program (reference number 94LA0815) and is an independent testing laboratory with no financial interest in GE, or its affiliates.

The following report (AEI reference project number YGE01) describes the test procedures, environmental conditions, equipment list, test data, and test results for the water heaters.

Sincerely,

Benjamin Risenhoover Project Engineer Appliance Engineering, Inc.

SUMMARY

The following table lists the model numbers, serial numbers, manufacturer's input rates (BTU/hr), measured NO_x emissions and dates tested for the residential hot water heaters tested.

GE				Unit #1
Model No. = GG50T**BXR01 Serial # = VS600143C			Test Date = May ated Input = 40,00 Capacity = 50 ga	0 BTU/hr
	Test 1		Test 2	Test 3
NOx (ng/J) =		•	35.6	34.4
Input Rate (BTU/hr) =	40,564	1	40,585	40,631

GE				Unit #2
Model No. = GG40S**BXR01 Serial # = VS600199C			Test Date = June ated Input = 38,00 Capacity = 40 ga	0 BTU/hr
	Test 1		Test 2	Test 3
NOx (ng/J) = 31.8		•	31	31.5
Input Rate (BTU/hr) =	38,494		37,308	38,261

GE				Unit #3
Model No. = GG40T**BXR01 Serial # = VS600055C			Test Date = June ated Input = 40,00 Capacity = 40 ga	0 BTU/hr
	Test 1		Test 2	Test 3
NOx (ng/J) =	NOx (ng/J) = 31.4		32.3	31.9
Input Rate (BTU/hr) =	39,943	3	40,029	39,910

The "**" listed in the model numbers above may be 08, 10, or 12. These variations are not representative of any physical difference in the units and are representative of the warranty which accompanies the particular unit.

All tests conducted according to SCAQMD Protocol "Nitrogen Oxide Emissions Compliance Testing for Natural Gas-Fired Water Heaters and Small Boilers", March 1995 (Amended January 1998) and SCAQMD Rule 1121 as amended September 3, 2004

1.0 OVERVIEW AND APPLICABILITY

The testing detailed in this report has been performed in accordance with SCAQMD protocols to insure compliance to the NOx emission requirements of Rule 1121.

2.0 ENVIRONMENTAL CRITERIA

The ambient temperature was maintained between 65 °F and 85 °F and did not vary more than ± 7 °F in a period of 15 minutes throughout the testing. The ambient temperature was recorded every fifteen seconds during the duration of calibration and testing. The relative humidity was between 20% and 65% during the test. The relative humidity and barometric pressure were recorded before and after each test.

3.0 DEFINITIONS

3.1 <u>Independent Testing Laboratory</u>: Appliance Engineering, Inc. is certified to SCAOMD Laboratory Approval Program via Reference No. 94LA0815.

4.0 TEST CONDITIONS

4.1 AMBIENT AIR TEMPERATURE

See above

4.2 SUPPLY WATER TEMPERATURE

4.2.1 Storage, Instantaneous, and Circulating Water Heaters

The water temperature supplied to the storage water heater was maintained at 72 ± 4 °F.

- 4.2.2 Not Applicable.
- 4.2.3 Not Applicable.

4.3 SUPPLY WATER PRESSURE

4.3.1 Water Heaters

When the water was not being withdrawn, the supply pressure was maintained between 40 psig and the specified maximum allowable pressure. When the water was being withdrawn, the supply pressure was adequate enough to maintain the specified test flow rate.

- 4.3.2 Not Applicable.
- 4.3.3 Not Applicable.

4.4 NATURAL GAS PRESSURE

The supply pressure was maintained at 7.0 in.w.c. The heating value was calculated from the measured composition of the natural gas supply using a gas chromatograph. The heating value was recorded before and after each test.

5.0 INSTUMENTATION

The following equipment was used to evaluate the NOx emissions per SCAQMD Protocol, "Nitrogen Oxide Emissions Compliance Testing for Natural Gas-Fired Water Heaters and Small Boilers", March 1995 (Amended January 1998) - Section 5.0 – "Instrumentation". All instrumentation was calibrated per SCAQMD Source Test Methods Chapter III, Calibrations, as well as Gas Consultants, Inc.'s QC Manual currently on file with SCAQMD.

5.1 PRESSURE MEASUREMENTS

A Dwyer U-tube water manometer was used for gas pressure measurements.

5.2 TEMPERATURE MEASUREMENTS

Tank Probe:

(6) Six, type-T thermocouple probes adjusted as described in Section 7.1.5 were connected to a data logging system terminal calibrated via the NIST traceable dry well calibrator.

Inlet/Outlet Probes:

Type-T thermocouple probes were connected to a data logging system and were calibrated via the NIST traceable dry well calibrator.

Ambient Probe:

Type-T thermocouple probes were connected to a data logging system and were calibrated via the NIST traceable dry well calibrator.

5.3 BAROMETRIC PRESSURE

Asset No.: 447
Manufacturer: Omega
Model No.: iBTHX-W
Serial No.: 9510545

5.4 LIQUID FLOW MEASUREMENTS

Water flow measurements are obtained with turbine flow meters and are for the convenience of the operator only. Total water consumption is obtained using calibrated scales as listed below.

5.5 NATURAL GAS FLOW

Dry gas meter used for input rate determination

Asset No.: 019

Manufacturer: American Meter Co.

Model No.: DTM-200 Serial No.: 83K273182

5.6 MASS MEASUREMENTS

Asset No.: 099

Manufacturer: First Weigh Model No.: DI-12 Serial No.: 151585

5.7 TIME

Time is measured using NIST traceable stopwatches.

5.8 FLUE GAS ANALYSIS

5.8.1 NOx Concentration:

Asset No.: 547

Manufacturer: Thermo Environmental Instruments Inc.

Model No.: 42i-LS Serial No.: 1502864125

Selectable Ranges (ppm): 0-10, 20, 50, 100, 200, 500

Custom Ranges (ppm): 0-10 to 500 Accuracy: ± 1%

5.8.2 CO concentration: See 5.8.3

5.8.3 Carbon Dioxide Concentration

Non-Dispersive Infra-Red (NDIR) Analyzer:

Asset No.: 368
Manufacturer: Seimens
Model No.: Ultramat 23

Serial No.: 7MB2337-8AG00-5CN1 Range: CO = 0 to 1000 ppm

 $CO_2 = 0$ to 10.0%

Accuracy: $\pm 1\%$

5.8.4 Sample Conditioning System

The sample conditioning system uses a refrigerated condenser/separator system that has been approved by SCAQMD. The description of this system is the following:

All fittings, solenoids and pumps are stainless steel. All tubing is Teflon or glass (i.e., inert to NOx). The sample line tubing is wrapped with an electrical heating cable that keeps the sample line at approximately 175 °F to prevent condensation before the conditioning system.

The sample conditioner consists of a Baldwin electronic, thermoelectric, cooling system (Model 325). The moisture laden, heated, flue gas sample enters the chiller (set point 32 °F) and the condensation descends to the bottom before the treated, sample flue gases leave the chiller. A drain system at the bottom of the chiller cylinder operates continuously to remove accumulated condensate.

5.8.4.1 Sample Probe

5.8.4.1.1 Integrating Sample Probes

An integrated sample probe constructed as described in Figure 3 of

SCAQMD's Protocol is constructed of 316 stainless steel tubing.

5.8.4.1.2 <u>Open Ended Sample Probes</u>

Not Applicable

5.8.4.2 <u>Sample Lines</u>

From the probe until it reaches the chiller system as described above, the sample line was heated to above 175 °F to prevent condensation before the moisture removal system.

5.8.4.3 Moisture Removal System

The moisture removal system is a chiller system as described above. The dew point of the dry gas is less than 35 °F (see 5.8.4).

5.8.4.3.1 <u>Permeation-Type Dryers</u>: DNA

5.8.4.3.2 <u>Refrigerated Condenser/Separator</u>: See above.

5.8.4.4 <u>Sample Pump</u>

The sample pump is a 316 stainless steel diaphragm pump with Teflon seals.

5.8.4.5 Flow Indicators

Indicators are for operators convenience; calibration not required. Water is not allowed to collect within the flow indicator tubes. Flow indictor in NOx system upstream of the analyzer has a special borosilicate glass indicator tube.

5.8.4.6 Sample Vent

All analyzers use an unrestricted atmospheric sample vent.

5.9 Natural Gas Composition

Type Used: Gas Chromatograph

Asset No.: 627

Manufacturer: SRI Instruments

Model No.: 8610C Accuracy: ±1.0% Calibration: Weekly

6.0 ANALYTICAL METHODS

The analytical methods followed were in accordance with SCAQMD Protocol, "Nitrogen Oxide Emissions Compliance Testing for Natural Gas-Fired Water Heaters and Small Boilers", March 1995 (Amended January 1998), Section 6.0 – "Analytical Methods" as described below:

6.1 START UP

6.1.1 Analyzer

All analyzers were allowed to warm-up overnight before testing any appliances.

6.1.2 <u>Sample Conditioning System</u>

The heated sample line was allowed to warm-up overnight. The condensate removal system was turned on one hour before testing, in order to allow the system to stabilize in temperature.

6.2 CALIBRATION AND PERFORMANCE TESTING

6.2.1 Analyzer Calibration

The analyzers were calibrated per SCAQMD's Method 100.1. The following gases were used for calibrating the analyzers.

Calibration Gases for NOx Analyzer

Supplier:	Airgas Great Lakes, Inc			
Accuracy:	NIST Traceable t	o ± 1%		
Cylinder No.	NOx(ppm)	Balance		
CC129899	27.23	Nitrogen		
CC443445	27.65	Nitrogen		
XC025608B	52.42	Nitrogen		

Calibration Gases for NDIR Analyzer: Supplier: Airgas Great Lakes Inc.

Supplier.	Aligas Ofeat La	kes, me	
Accuracy:	NIST Traceable	to ± 1%	
Cylinder No.	CO(ppm)	CO2(%)	Balance
XC027430B	489.8	4.98	Nitrogen
952617	447.5	4.539	Nitrogen
CC433420	941.3	9.508	Nitrogen

6.2.2 <u>Sampling System Bias Test</u>:

The sampling system bias test was performed per SCAQMD Method 100.1 before and after testing. The bypass flow rate was not altered during the calibration procedure.

6.2.3 Response Time:

Since an integrated probe was used and not the multi-point transverse method, it was not required to perform and record the response time.

6.2.4 NO₂ to NO Conversion Efficiency:

The converter efficiency is measured in accordance with EPA method 20 at least once a month.

6.3 Analysis:

6.3.1 Sample Point:

6.3.1.1 Appliances with Vents Less Than 12 Inch Diameter:

An integrating probe of the proper length was used for each model tested.

6.3.1.2 Appliances with Vents 12 Inch Diameter or Greater:

Not Applicable.

6.3.2 Sampling Periods:

6.3.2.1 Integrating Sample Probes:

A continuous sample was taken after calibration through the end of the test.

6.3.3 <u>Data Recording</u>:

The output of each analyzer was recorded to a data logger once every 5 seconds.

7.0 INSTALLATION

The water heaters were set up according to SCAQMD Protocol, "Nitrogen Oxide Emissions Compliance Testing for Natural Gas-Fired Water Heaters and Small Boilers", March 1995 (Amended January 1998), Section 7.0 - "Installation" as described below:

7.1 Storage Tank Water Heaters with Input Ratings Below 75,000 BTU/hr

7.1.1 <u>Water Heater Mounting</u>:

The water heater was installed per manufacturer's instructions.

7.1.2 Water Supply:

The water supply was capable of delivering water at conditions specified in Sections 4.2 and 4.3 of this protocol.

7.1.3 Water Inlet and Outlet Configuration:

Inlet and Outlet piping connections were configured as illustrated in Figure 4, 5 and 6. Type "L" hard copper tubing was connected and extended 24 inches in length. The appliance was taller than 36 inches. A pressure gauge was installed in the supply at a location upstream of the 24-inch cold water, inlet pipe. A temperature and pressure relief valve was installed on the water heater at the port specified by the manufacturer. Non-metallic piping was used on the discharge connection of the relief valve.

7.1.4 Fuel Consumption:

Equipment was installed per Section 5.5.

7.1.5 <u>Internal Storage Tank Temperature Measurements:</u>

Six (6) type-T temperature thermocouple probes were installed inside the water heater tank with a vertical distance of at least four (4) inches between successive probes. The probes were positioned at the vertical midpoint at each of the six equal volume nodes within the tank. The temperature probes were positioned away from any anodic protective devices, tank walls and flue pipe walls. The tank

accommodated the maximum number of sensors, which complies with the installation requirements. The temperature probes were installed through the anode opening of the tank.

7.1.6 <u>Ambient Temperature</u>:

The ambient temperature is measured at the approximate vertical mid-point of the heater and approximately 2 feet from the surface of the water heater. The ambient temperature probe was shielded against radiation.

7.1.7 Inlet and Outlet Water Temperature Measurements:

The inlet and outlet water temperature probes were installed as shown in Figure 4 of this protocol.

7.1.8 Flow Control:

A flow control valve was installed to provide flow as specified within Section 8 of this protocol.

7.1.9 Vent Requirements:

All conventional draft hood-type water heaters were vented with a five-foot double-wall vertical vent pipe. All direct-vent water heaters were installed according to the manufacturer's instructions with the emissions sample taken just prior to the exhaust outlet. All power-vented water heaters were vented with a five-foot, single-wall (PVC) vent pipe, attached to the outlet of the exhaust blower.

7.1.10 Natural Gas Sample:

Natural gas sample was injected directly from gas supply line to gas chromatograph for analysis.

- 7.2 Not Applicable.
- 7.3 Not Applicable.
- 7.4 Not Applicable.

8.0 TEST PROCEDURE

The testing was performed per SCAQMD Protocol, "Nitrogen Oxide Emissions Compliance Testing for Natural Gas-Fired Water Heaters and Small Boilers", March 1995 (Amended January 1998), Section 8.0 – "Test Procedures" as described below:

8.1 Storage Tank Water Heaters with Input Ratings Below 75,000 BTU/hr

8.1.1 Power Input:

The unit was adjusted to within \pm 2% of the manufacturer's specified BTU/hr input rate. The manifold pressure was adjusted to within \pm 10% of the specified manifold pressure setting, in order to obtain the rated input.

8.1.2 <u>Determination of Storage Tank Volume</u>:

Storage tank capacity (Vst) of the water heater was determined by subtracting the tare weight from the gross weight and dividing the resulting net weight by the density of the water at the temperature at which the tank was measured.

8.1.3 <u>Setting the Thermostat</u>:

The thermostat dial was adjusted so that the maximum mean tank temperature after cutout was 135 °F \pm 5 °F.

8.1.4 Emissions Testing:

Emissions testing performed as follows:

- 1) The water heater is allowed to come up to temperature.
- 2) Prior to calibration the following information is manually recorded:

Heating Value

Barometric Pressure

Gas Temperature

Humidity

- 3) When the heater reached 135 °F the computer was turned ON and initial calibration was conducted.
- 4) The computer is programmed to record the:

Average tank temperature

Inlet and Outlet water temperatures

Room temperature (ambient)

Water flow (indicates when water is turned ON and OFF)

Burner ON and OFF

NOx, CO-2, CO

5) After the calibration procedure, the computer control program is activated and documents the following tasks:

Water ON for the initial 10-gallon draw.

Burner 'cut-in' has occurred.

Water OFF after 10-gallon draw or burner 'cut-in'.

Maximum mean tank temperature achieved.

The steps above are repeated for the 10.7-gallon draw.

- 6) The average ambient temperature is determined. The arithmetic mean of the inlet and discharge water temperatures during the test was determined. The weight of the water drawn and gas consumption is measured and recorded manually.
- 7) The arithmetic mean of the CO-2 and NOx concentrations is measured for calculations during the last three 'one-minute' periods of the testing. The 'maximum mean-tank-temperature' is recorded at the end of the test.
- 8) After the emission testing is completed, the post calibration procedure is performed.
- 8.2 Not Applicable
- 8.3 Not Applicable.

8.4 Not Applicable.

9.0 CALCULATIONS

All calculations were done using the formulas found in 'Section 9' of SCAQMD Protocol, "Nitrogen Oxide Emissions Compliance Testing for Natural Gas-Fired Water Heaters and Small Boilers", March 1995 (Amended January 1998)

This calibration was performed using measurement standards that are traceable to the International System of Units (SI) through NIST or other national metrology institutes (NMIs). The calibration system complies with the requirements of ISO/IEC 17025.

Measured values and ancertainties are expressed in terms of the indicated parameter, for example, scfh (base units).

Measurement uncertainties are calculated in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). Uncertainties are expressed using a coverage factor of k = 2, corresponding to a confidence level of approximately 95%.

This report applies only to the Item identified. This report shall not be reproduced, except in full, unless written permission for an approved abstract is obtained from CSA Group. This report shall not be used to claim product endorsement by CSA Group.

This certificate indicates Traceability to standards provided by (NIST) National Institute of Standards and Technology and/or a National Standards Laboratory.

A Test Uncertainty Ratio of at least 4:1 te maintained unless otherwise stated and is calculated using the expansion measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO 'Guide to the Expression of Uncertainty in Measurement: (GUM). The uncertainty represents an expanded uncertainty using a coverage factor kin2 to approximate a 05% confidence level. In least increase confidence are based on tost results stating within specified letter with uncertainty of the measurement. The neutral contained between related only to the Earn calibrated. This certificate shall not be reproduced except in full, without written approved of Control Company.

Nominal-Standard's Reading: As Lots-halmment's Reading; in Tel-in Tolerace; MinMaxnAcceptance Renge; & UnExpanded Measurement Uncertainty, TURinTest Uncertainty, Ratio, Acceptance Renge; & UnExpanded Measurement Uncertainty, TURInTest Uncertainty, Ratio, Acceptance Renge; & University Ratio, Accep

Maintaining Accuracy:

In our opinion once calibrates your Jumbo-Digit Stopwatch should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Jumbo-Digit Stopwatch change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

For factory calibration and re-certification traveable to National Institute of Standards and Technology contact Control Company.
